

Tips

As you tip the candles, rotate them slightly so that a lip does not form on one side.

If you leave a second candle burning while you drip another, a pool of wax will form that can be poured at once.

If you are using our black light candles remember that the colour will be different under the black light.

If using other varieties of wax, ensure that the melting point is no more than 95°F. At 120°F you may form blisters from the heat.

Sheets of “poly” (Clear Plastic) can be found in most dollar stores where painting supplies are, or bought in a roll from hardware stores.

Skin is very sensitive after the wax is removed. Using sensory items (fingernails, feathers, wartenburg wheels etc) after wax is removed may have interesting results.

Hot Wax

Hot wax play is when wax is melted to drip or brush onto the skin, either for sensual play or for sado/masochistic play, depending on the wax used.

Candles sold by ASPECC are designed for sensual play. They are made with spa grade paraffin wax and melt at 80-91°F. This temperature is safe for most skin types, when dripped from a height of 8" or more away from the skin. Non-paraffin candles can melt at a higher temperature and may cause burns.

NOT ALL SKIN TYPES WILL TOLERATE HOT WAX

Some individuals cannot tolerate hot wax on their skin and they may develop burns. In order to test the wax safely, ensure you begin dripping from a higher height (18" recommended), to see how the skin reacts. If the person you are dripping wax on tolerates this well, you can lower the height, based on their skin (and their verbal) reaction.

General Instructions

1. Ensure that you have a safe area to play with the wax. You will need something to protect the surface the person is laying/sitting on (wax may stain sheets, bedding, surfaces). You will also need something flat and stable to place candles on.

2. Plan Ahead! Have a cold cloth handy (in case it burns), a towel for removing any stubborn wax, water for hydration, and have your candles, baby oil and a lighter nearby.

Optional Smooth baby oil (or similar) over the skin. A very light coating of baby oil will make the wax removal process a breeze, and the oil disperses the heat of the wax, which is a lovely sensation.

3. Remove the label from candle, trim wick and light. If the candle smokes, the wick may be too long.

4. From a height of 18", hold the candle above the skin to receive wax. Tilt the candle slightly, allowing melted wax to drip.

Instructions con't

6. Check in with the person you are dripping wax on. If they feel that it's not too hot, then you can drip from slightly lower height. (Repeat this step until you find the height that works for your partner.)

**Note:*

When you drip wax on a spot that has cooled wax, the heat does not transfer as well, which means you can drip the wax from closer to the skin. Black and Red wax are slightly hotter than other colours.

Clean Up

The wax will peel off their skin easily if you used oil. Otherwise you may need to use a towel or rag to rub off the wax. If you used a sheet (or a sheet of poly) you can roll up the mess and dispose of it easily.
